Lecture 3

DAY 3

- Ownership
- Permissions
- Connection to other Hosts
- Copying Files between Hosts

Ownership

Every file and directory on your Unix/Linux system is assigned 3 types of owner, given below:

- Users
- Groups
- Others

Ownership

How to change the ownership of files or directories?

To change the owner (USER):

`chown rana mycv.txt` → To change the owner of the file `mycv.txt` to Rana

`chown 1000 myteam` → ?

`chown mohamed file1 file2` → To change ownership of multiple files

Ownership

How to change the ownership of files or directories?

To change the group:

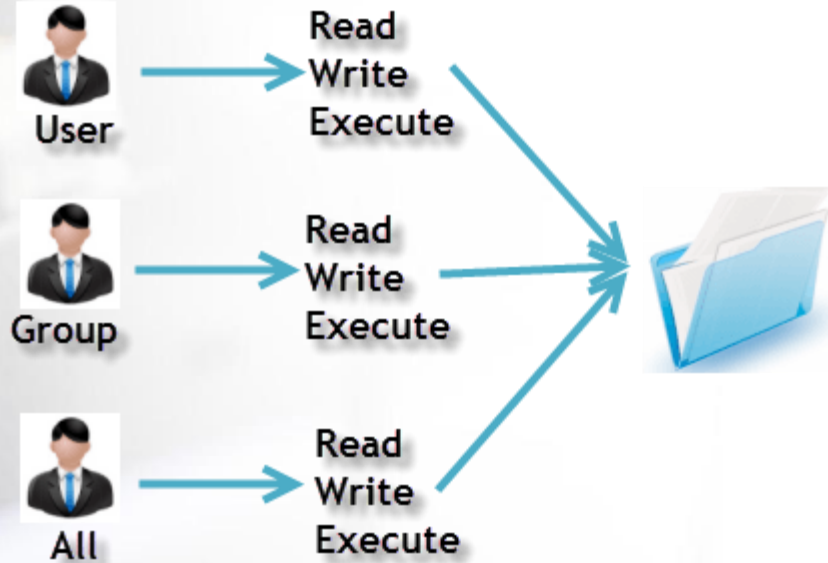

`chown rana:AI mycv.txt` → To change the owner of the file `mycv.txt` to Rana and the group to AI

`chown :AI myteam` → ?

`chown -R selim:AI /home` → To change the owner to Selim and the group to AI, recursively on all the content under `/home`

Permissions

Owners assigned Permission On Every File and Directory

Permissions

File type and Access Permissions.

```
home@VirtualBox: ~  
home@VirtualBox:~$ ls -l  
-rw-rw-r-- 1 home home    0 2012-08-30 19:06 My File
```

-rw-rw-r--

↓
indicates
file

↓ d represents directory

```
drwxr-xr-x 2 ubuntu ubuntu 80 Sep  6 07:27 Desktop
```

Permissions

r = read permission
w = write permission
x = execute permission
- = no permission

- It's a file
- User has read and write permissions
- Group has read and write permissions
- Others have read permissions
- No one has execute permissions

`-rw-rw-r--`
 ↓
 no execute
permission

Permissions

How to change the permissions of a given file or directory?

- ☐ chmod permissions filename

There are 2 ways to use the command chmod:

- ☐ Absolute mode (Numeric)
- ☐ Symbolic mode

Permissions

Number	Permission Type	Symbol
0	No Permission	---
1	Execute	--x
2	Write	-w-
3	Execute + Write	-wx
4	Read	r--
5	Read + Execute	r-x
6	Read + Write	rw-
7	Read + Write + Execute	rwX

Permissions

Checking Current File Permissions

```
ubuntu@ubuntu:~$ ls -l sample  
-rw-rw-r-- 1 ubuntu ubuntu 15 Sep  6 08:00 sample
```

chmod 764 and checking permissions again

```
ubuntu@ubuntu:~$ chmod 764 sample  
ubuntu@ubuntu:~$ ls -l sample  
-rwxrw-r-- 1 ubuntu ubuntu 15 Sep  6 08:00 sample
```

764 absolute code says the following:

- Owner can read, write and execute
- Usergroup can read and write
- World can only read
- This is shown as '-rwxrw-r--'

Permissions

In the Absolute mode, you change permissions for all 3 owners. In the symbolic mode, you can modify permissions of a specific owner.

Operator	Description
+	Adds a permission to a file or directory
-	Removes the permission
=	Sets the permission and overrides the permissions set earlier.

User Denotations	
u	user/owner
g	group
o	other
a	all

Permissions

- `chmod g+w file1` → To add write permissions to the owning group.
- `chmod o+w file1` → ?
- `chmod u-w file1` → ?
- `chmod go-rw file1` → To remove read and write permissions from group and others and leaving the user as is.
- `chmod u+w,g+wx,o+r file1` → ?

Permissions

- `chmod u=rw,g=r,o=r file1` → Resets all old permissions to ?
- `chmod a+x file1` **OR** `chmod ugo+x file1` → To add execute permissions to all (user, group and others)
- `chmod a=rw file1` **OR** `chmod ugo=rw file1` → ?
- `chmod u= file1` → Removes all permissions from owner
- `chmod +rw file1` **OR** `chmod u+rw file1`

Permissions

- ☐ `chmod =rw file1` **OR** `chmod u=rw file1`
- ☐ `chmod -R g+rx dir1` → To change files and directories recursively to ?
- ☐ `chmod 754 file1` → rwx for user, r-x for group, r- for others
- ☐ `chmod 400 file1` → r-- for user, --- for group, --- for others
- ☐ `chmod -R 755 dir1` → ?
- ☐ `chmod 421 file1` → ?
- ☐ `Chmod 777 file1` → ?

A whiteboard with several markers (red, black, and white) is visible in the upper left. A large, bright red starburst graphic is centered on the page, containing the word "BREAK" in a bold, white, sans-serif font. The background of the slide is a solid dark red color.

BREAK

Connection to Other Hosts

As we all know, that each device has a different IP on the network.

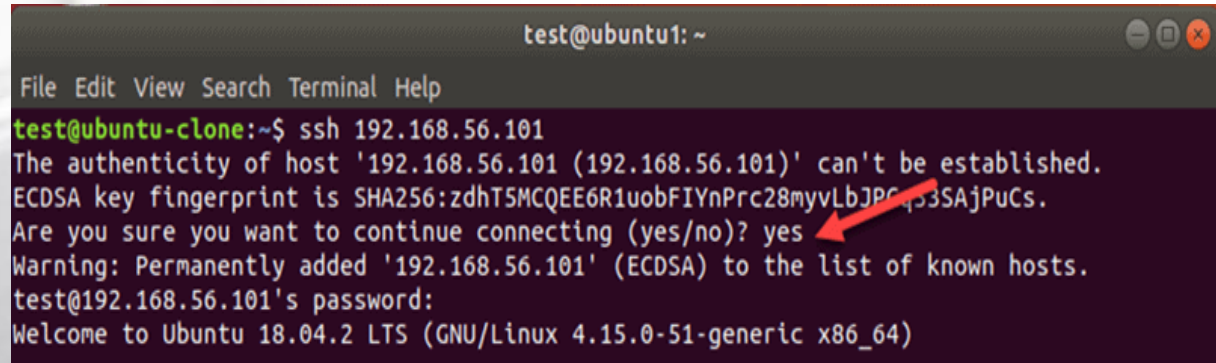

We can run commands on different hosts, by issuing the SSH command followed by what we need to do: *ssh server ls /tmp/doc*

We can use IP or hostname when using SSH, and login as specific users on other hosts: *ssh username@hostname_or_ip*

Connection to Other Hosts

```
ssh 192.168.56.101
```

```
ssh ITI_AI_Intake1
```

```
test@ubuntu1: ~  
File Edit View Search Terminal Help  
test@ubuntu-clone:~$ ssh 192.168.56.101  
The authenticity of host '192.168.56.101 (192.168.56.101)' can't be established.  
ECDSA key fingerprint is SHA256:zdHT5MCQEE6R1uobFIYnPrC28myvLbJPCq53SAjPuCs.  
Are you sure you want to continue connecting (yes/no)? yes  
Warning: Permanently added '192.168.56.101' (ECDSA) to the list of known hosts.  
test@192.168.56.101's password:  
Welcome to Ubuntu 18.04.2 LTS (GNU/Linux 4.15.0-51-generic x86_64)
```

Copying Files between Hosts

SCP (secure copy) is a command-line utility that allows you to securely copy files and directories between two locations.

With scp, you can copy a file or directory:

- ☐ From your local system to a remote system
- ☐ From a remote system to your local system
- ☐ Between two remote systems from your local system

```
scp user@SRC_HOST:file1 user@DEST_HOST:file2
```

Copying Files between Hosts

```
scp file.txt remote_username@10.10.0.2:/remote/directory
```

file.txt: The name of the file we want to copy

remote_username: The user on the remote server

10.10.0.2: The server IP address.

The /remote/directory: The path to the directory you want to copy the file to.

If you don't specify a remote directory, the file will be copied to the remote user's home directory.

You will be prompted to enter the user password, and the transfer process will start.

Output

```
remote_username@10.10.0.2's password:
```

```
file.txt                                100%  0  0.0KB/s  00:00
```

Copying Files between Hosts

To securely copy a whole directory, we add the option `-r` to the command:

```
scp -r /local/ITI remote_username@10.10.0.2:/remote/ITI
```

❖ The command transfers from a local directory to a remote directory

```
scp -r remote_username@10.10.0.2:/remote/ITI /local/ITI
```

❖ The command transfers from a remote directory to a local one
